RE: East Airfield EA – Transportation Analysis Appendix, Revised

This memo is a revised version of the transportation analysis completed to support the Environmental Assessment (EA) for the East Airfield Development Area (EADA) at Orlando International Airport (OIA). Additional documentation is provided in this summary report related to the trip rates used for the EADA, and new information is provided which has become available since our previous analysis and justifies that **no roadway segments will experience a disruption in local traffic patterns that substantially reduce the level of service (LOS) as a result of the Proposed Action** (i.e., development of the EADA). The original EA transportation analysis memo dated October 7, 2008 is included as Exhibit A.

Off-Site Roadway Impacts Background

As background information, it is important to note that in accordance with the Federal Aviation Administration (FAA) Policy and Procedures Concerning the Use of Airport Revenue; Notice, 64 Fed. Reg. 7,696, 7,720 (February 19, 1999) (Revenue Use Policy), GOAA has never participated in off-airport improvements for aviation-related projects at OIA. Historically, GOAA has conducted traffic impact studies to evaluate off-airport roadway conditions, identified roadway segments that merit widening or new construction and worked with other government agencies to advocate completing the off-airport improvements. GOAA has not been precluded from advancing or constructing airport projects because an off-airport transportation project has not been completed by another local government agency. In its role of advocate GOAA has facilitated the following completed projects as examples:

- Goldenrod Road Extension and new interchange at SR 528 (with connection to Heintzelman Boulevard)
- Conway Road widening from 2 to 4 lanes
- SR 436 widening from 4 to 6 lanes
- Modified interchange at SR 436 and SR 528
- Widening of Narcoossee Road (multiple segments)

FAA Review Standards vs. DRI Standards

FAA's *Order 5050.4B National Environmental Policy Act (NEPA) Implementing Instructions For Airport Actions,* Chapter 7 Environmental Assessment, Table 7-1, Significance Thresholds and *Environmental Desk Reference for Airport Actions,* Chapter 18 Social Impacts, provide the relevant review standards for determining social impacts, including transportation, in the review of airport-related environmental documents. Relative to transportation effects, the applicant is to provide information on the Proposed Action's potential to cause a disruption of local traffic patterns that substantially reduce the LOS of any airport access roads or roads in the areas immediately surrounding the airport, with discussion of any unacceptable changes in roadway LOS.

It should be noted that the FAA review standards differ from the transportation analysis required as part of Florida's Development of Regional Impact (DRI) process, which assesses project significance based on the project contributing a volume to a roadway segment equal to or greater than 5% of the roadway's maximum service volume at the adopted LOS. The DRI transportation analysis study area is traditionally established based on roadways identified as being significantly impacted by the project, plus one roadway segment beyond where the project significance ends. Roadways are identified as having a significant and adverse impact on a roadway segment if the project meets the 5% significance test and the roadway is projected to operate deficiently (below its adopted LOS standard).

Differences in the two methodologies can be summarized as follows:

- The DRI study area tends to be large and considers regional impacts defined by the 5% project significance threshold. Conversely, the FAA guidelines only require evaluation of airport access roads or roads in areas immediately surrounding the airport.
- Regional roadways may be projected to experience an unacceptable change in roadway LOS in the future even without a Proposed Action based solely on the projected growth of non-project, background traffic. The FAA guidelines imply that a roadway would only be identified as having a transportation impact based on the Proposed Action if the Proposed Action causes the unacceptable change in roadway LOS. In contrast, the DRI methodology considers total traffic, and not whether a particular roadway segment would operate deficiently without the Proposed Action (with non-project, background traffic only), that is, a roadway can operate adversely without being significantly impacted by the project based on the DRI methodology and definitions.

The EADA will go through additional DRI level of review in order to be incorporated into the OIA Amended and Restated Development Order, or alternatively, through the local development level of review. The transportation analysis previously provided used the more stringent DRI methodology and not the standard referenced in FAA guidance documents.

Orlando Southeast Sector Plan History

More than 15 years ago, the City of Orlando identified Southeast Orlando as a Future Growth Center with OIA as the primary economic and employment generator. In 1999, the City of Orlando adopted the Southeast Sector Plan, as part of the City's Growth Management Plan Future Land Use Element. The Southeast Sector Plan provides development guidelines and standards for Southeast Orlando, including the EADA, envisioned to provide a full range of uses, services, amenities, and activities to fill the needs of the ultimate population of roughly 65,000. The plan states:

> *"The Orlando International Airport is a strong and growing economic engine within the region. The Greater Orlando Aviation Authority, GOAA, plans to construct a fourth runway, expand terminal facilities, build new onsite roadways, pursue regional rail transit linkages, and actively market airport-related industrial, office and commercial development. The Southeast Orlando area is directly adjacent to this significant regional center and has the potential to benefit by serving as a prime location for new office and industrial development. In addition, the Southeast Orlando area's location can capitalize on traffic to the airport through strategically placed commercial/lodging activities, and by providing a full range of housing that is both affordable and convenient for airport employees."* [*Southeast Orlando Sector Plan Development Guidelines and Standards, May 10, 1999*]

The Southeast Sector Plan designates the future land use for the EADA as Airport Support District, a land use category which includes the primary employment locations within the Southeast Orlando community [Section 68.105, Orlando City Code]. As such, the EADA has since 1999 been envisioned by the City for a high level of employment intensity, and the surrounding infrastructure has been planned and designed to accommodate the development of the EADA and surrounding uses.

It can be seen that proposed development in Southeast Orlando represents the fulfillment of a well conceived plan, and the EADA is consistent with and is an important component of the Sector Plan.

Trip Generation Rates

The appropriate trip generation rates for aviation support development have long been discussed at OIA. The Institute of Transportation Engineers (ITE) *Trip Generation, 8th Edition* is used as the professional standard for trip generation rates for traffic impact analyses. There are no land use categories in the ITE document that cover the specific use and trip-making characteristics of the very specialized uses generally located at aviation facilities. In the past, the trip generation of aviation support parcels including the EADA has been estimated using light industrial, manufacturing, or warehousing trip rates, or using a blended rate based on a combination of these rates in ITE *Trip Generation*. However, in 2008, GOAA authorized HDR to collect traffic data from various properties located at OIA along the Tradeport Drive and Hangar Boulevard corridors that represented existing aviation support uses consistent with the types of uses planned for at the EADA. This is consistent with guidance in ITE's *Trip Generation Handbook: An ITE Recommended Practice*, which states: "if the description of a site is not covered by the land use classifications presented in *Trip Generation*, the analysis should collect local data and establish a local rate." [*ITE Trip Generation Handbook: An ITE Recommended Practice*] The traffic data collection was undertaken at existing aviation support uses at OIA based on the established guidelines in the ITE Recommended Practice, including:

- Number of sites – at least three sites (and preferably five) are recommended to be surveyed. A total of 10 individual aviation support sites were counted at OIA, which were ultimately separated into two categories, with 6 and 4 sites representing Category A: Airport Support District (aircraft maintenance/manufacturing hangar/cargo facilities) and Category B: Airport Support Area (office/flight training centers/air traffic control facilities), respectively.
- Duration – counts were conducted for the recommended 7-day period, with the exception of the air traffic control tower, which was counted for the minimum preferred length of 48 hours.
- Verification – all automatic driveway counts were verified and adjusted based on one-hour manual counts completed at each count location.
- Acceptable use of weighted average trip generation rate – all weighted average trip rates computed for OIA aviation support were verified as acceptable according to ITE standards, which requires that the weighted average trip generation rate is based on at least three data points with a computed standard deviation that is no more than 110 percent of the weighted average rate.
- Site selection – sites selected all had reasonably full occupancy; were mature (at least two years old); and were able to be isolated for counting purposes.

As an example, monitored trip rates have been used for traffic analyses at OIA for the South Terminal DRI, which made use of monitored traffic volumes at the airport's cordon line to accurately establish the airport's trip generation and to project the anticipated trip generation of the proposed South Terminal. The analysis was accepted by the reviewing agencies (including the City of Orlando, East Central Florida Regional Planning Council, and FDOT) and incorporated into the OIA Amended and Restated Development Order.

The monitored trip generation rates for the two land use categories are as follows:

- Category A: Daily = 7.23 trips/KSF PM Peak Hour = 0.42 trips/KSF (60% enter, 40% exit)
- Category B: Daily = 9.50 trips/KSF PM Peak Hour = 0.50 trips/KSF (26% enter, 74% exit)

It was noted that the monitored OIA aviation support trip rates for daily traffic were higher than the blended ITE daily trip rate (combination of light industrial, manufacturing, and warehousing), but that the monitored PM peak hour trip rates were lower than the blended ITE PM peak hour rates. This is expected considering that many of the OIA aviation support uses have three employee shifts, resulting in more trips per day compared to the uses that are represented by ITE rates (and many of which do not operate with employee shifts). However, because the employee shift changes at OIA often occur outside of the 4-6 PM commuter peak period, the trip generation during this crucial period is lower than ITE rates. It is also noted in the ITE land use descriptions for light industrial, manufacturing, and warehousing that the peak hour of the generator typically

coincided with the peak hour of the adjacent street traffic. However, for the OIA aviation support uses, the monitored rates showed that in nearly all cases, the peak hour of the generator did not coincide with the peak hour of the adjacent street traffic, further supporting the expected outcome that many aviation support trips occur outside the most critical commuter peak periods.

The DRI transportation analysis traditionally focuses on the PM peak period, which represents the most critical and congested time period of the day. The EADA analysis using the monitored rates is based on the projected conditions during the PM peak period and also includes, for informational purposes, the daily trip generation based on monitored rates.

The aviation support traffic data and computation of monitored aviation support trip generation rates is included in Exhibit B.

Transportation Analysis Results

Based on the use of the monitored trip rates and a total EADA development program of 6.1 million square feet depicted in the preferred alternative (see Figure 4.3-4 of the EA document), the Proposed Action is projected to generate 46,709 daily trips and 2,654 PM peak hour trips (1,398 entering, 1,256 exiting). Based on the projected trip generation and the use of the DRI transportation methodology, the following four roadway segments were originally identified in the October 2008 traffic analysis as having DRI impacts:

- Narcoossee Road, Lee Vista Boulevard to SR 528/Beachline Expressway
- Narcoossee Road, SR 528/Beachline Expressway to Dowden Road
- Narcoossee Road, Dowden Road to Lake Nona Boulevard
- SR 436/Semoran Boulevard, Hoffner Avenue to SR 528/Beachline Expressway

It should be noted that each of these four roadway segments are projected to operate deficiently in the future based solely on the growth of non-EADA background traffic even in the absence of the EADA development. As such, the addition of the Proposed Action would not cause a disruption in traffic patterns which reduces the roadway LOS. Further, none of the four segments are projected to have DRI impacts based on current information, as detailed in the following section.

Addressing Previously Identified Impacts

Since the completion of the EA transportation analysis in 2008, the local Metropolitan Planning Organization (MPO), MetroPlan Orlando, adopted the MetroPlan Orlando 2030 Cost Feasible Long Range Transportation Plan (Transportation Plan) and the City of Orlando adopted amendments to its transportation policies included as part of the City's Growth Management Plan (GMP).

MetroPlan Orlando adopted the Transportation Plan on August 12, 2009. The Cost Feasible plan includes widening of each of the three identified Narcoossee Road segments by 2030 or earlier. These improvements were not considered during the previous EA transportation analysis. However, these improvements have been justified as financially feasible by MetroPlan Orlando without relying on developer contributions (proportionate share contributions) in the accounting of funding sources needed to implement the improvements included in the plan. The result of including the planned widening of the three Narcoossee Road segments identified in the EA transportation analysis is that none of the roadways would operate deficiently. Therefore, the DRI impacts on these segments would be eliminated and since the DRI threshold has not been exceeded, the less stringent FAA standard set forth above has not been exceeded. Documentation of the 2030 MetroPlan Orlando Cost Feasible Long Range Transportation Plan projects is included in Exhibit C.

The City of Orlando recently amended its GMP to expand the existing Transportation Concurrency Exception Area (TCEA) to include the current corporate limits of the City of Orlando as of July 7, 2009, and address applicable portions of The Florida Community Renewal Act, section 163.3180(4)(b), requirements regarding transportation strategies to support and fund mobility, including the following policies within the City of Orlando GMP Transportation Element:

- Policy 1.8.3 states “Where an assessment of the level of service is required for major thoroughfares the default Level of Service (LOS) Standard for major thoroughfares shall be as follows: 1) LOS Standard “E”, or 2) If the roadway is operating at LOS “F”, it shall not be significantly degraded.”
- Policy 1.8.7 states “Major thoroughfares operating at a level of service of “F” shall not be significantly degraded as a result of a proposed new development project, unless the City approves a mitigation plan. Significant degradation occurs when the increase in vehicles per hour per lane (vphpl) exceeds the following percentages:

  Limited Access Facilities
  4 Lanes 29%
  6 Lanes 18%

  Arterials and Collectors
  2 Lanes Undivided 56%
  4 Lanes Undivided 34%
  4 Lanes Divided 25%
  6 Lanes Divided 17%

  One-Way Roads
  2 Lanes 25%
  3 Lanes 17%
  4 Lanes 15%

  Constrained Facilities
  4 or 6 lanes 10%

The above policies include the assessment of the roadway condition at the specific point in time; for example, a 2030 analysis would include assessment of the LOS of the roadway based on 2030 background traffic to determine if it was operating at LOS F, which would allow the significant degradation thresholds to apply. This methodology was used in the transportation analysis completed for the City of Orlando on GOAA’s Poitras property, and is documented in the Poitras Property City of Orlando Planned Development (PD) Transportation Study (August 2010).

The fourth roadway segment identified as impacted in the EA transportation analysis is SR 436/Semoran Boulevard from Hoffner Avenue to SR 528. According to Section 163.1380(10), the City of Orlando is responsible for setting the appropriate LOS standard on this segment because it is located within a TCEA, is not part of the Strategic Intermodal System (SIS), and was not funded in accordance with Section 339.2819, F.S. which creates the Transportation Regional Incentive Program (TRIP). Based on the City’s amended GMP policies referenced above, this segment would be subject to the significant degradation thresholds in Policy 1.8.7 because at the buildout of the EADA, this segment is projected to be operating at LOS F due to future background traffic volumes (the total non-EADA PM peak hour peak direction volume is projected to be 2,950 which is beyond the upper threshold for LOS E of 2,710, thereby putting it into LOS F). However, the total projected volumes from the analysis (future background traffic + EADA traffic = 3,155 PM peak hour peak direction trips) would not exceed the significant degradation threshold of the LOS F service volume + 17% (3,171). Although this segment is projected to operate at LOS F, the Proposed Action will not result in an unacceptable change in roadway LOS since the segment is projected to operate below the level at which point it would be considered “significantly degraded” by the City.

Conclusions

The following conclusions can be drawn from the information presented in this revised memo summarizing the results of the EADA EA transportation analysis:

- Although the transportation analysis has relied on the DRI transportation methodology, the EA requires that the review guidelines in the FAA's *Order 5050.4B National Environmental Policy Act (NEPA) Implementing Instructions For Airport Actions,* Chapter 7 Environmental Assessment, Table 7-1, Significance Threshold and the *Environmental Desk Reference for Airport Actions,* Chapter 18 Social Impacts be met. This includes the Proposed Action's potential to disrupt local traffic patterns that substantially reduce the LOS of any roads serving the airport or in the areas immediately surrounding the airport, and identification of any unacceptable changes in roadway LOS. This memo has provided additional information that was not available for inclusion in the October 2008 EA traffic analysis that demonstrates that the Proposed Action will not result in any disruption of local traffic patterns that substantially reduce the LOS of any road serving the airport or the areas immediately surrounding the airport causing an unacceptable change in roadway LOS.
- Since 1999 the Southeast Orlando Sector Plan and the City of Orlando Growth Management Plan has included uses consistent with the EADA. The land use plan included in the EA is consistent with and is an important component of this plan, which recognizes that GOAA will be actively marketing airport-related industrial, office and commercial development, and that the EADA will serve as a primary employment location within Southeast Orlando.
- The collection of trip data for OIA aviation support development and the computation of local monitored trip generation rates are based on ITE standards and procedures and are justified because existing land use categories in ITE's *Trip Generation* do not cover the specific use and trip characteristics of aviation support uses proposed at EADA. Monitored rates have been used in the Orlando area in the past, including for the OIA South Terminal DRI.
- The use of the OIA aviation support trip rates and the proposed EADA development program totaling 6.1 million square feet was projected to result in the project exceeding DRI thresholds on 4 roadway segments, based on the standard DRI transportation methodology and the transportation analysis completed in October 2008. However, based on new information received from MetroPlan Orlando and the City of Orlando following the completion of the EA transportation analysis, these impacts would be eliminated and the Proposed Action would not exceed the DRI thresholds which in turn will not result in an unacceptable change in roadway LOS on these 4 roadway segments based on the following:
    - MetroPlan Orlando's 2030 Cost Feasible Long Range Transportation Plan (adopted August 12, 2009) includes financially feasible widening improvements to the 3 identified segments of Narcoossee Road; as such, none of these segments would operate deficiently (i.e., at an unacceptable LOS) at the buildout of the EADA.
    - The City of Orlando's revised GMP includes policies that expand its TCEA city-wide and permits new development on major thoroughfares operating at a level of service of "F" so long as they are not significantly degraded (unless the City approves a mitigation plan). The identified segment of SR 436 is projected to operate at LOS F at the buildout of the EADA but is not projected to be significantly degraded based on the City's established thresholds. As such, the Proposed Action would not result in an unacceptable change in roadway LOS for this segment.
- Finally, in accordance with the FAA Revenue Use policy, GOAA has never participated in off-airport improvements for aviation-related projects at the airport. GOAA identified needed transportation improvements, and has served as an advocate along with other government agencies to get improvements completed. GOAA has not been precluded from advancing or constructing an airport projects because an off-airport transportation project has not been completed by another local government agency.

CC:	Jason McGlashan, HDR		
Date:	October 7, 2008	Job No:	85817

RE: East Airfield EA – Revised Development Program Trip Generation

Based on our meeting last week, HDR has made revisions to the trip generation calculations and roadway segment analysis for the East Airfield. Based on the traffic counts that were conducted and the exclusion of the Air Tran and Signature FBO uses, the computed trip generation rates for the two land use categories are as follows:

- Category A: Daily = 7.23 trips/KSF PM Peak Hour = 0.42 trips/KSF (60% enter, 40% exit)
- Category B: Daily = 9.50 trips/KSF PM Peak Hour = 0.50 trips/KSF (26% enter, 74% exit)

As discussed at the meeting, the actual measured **daily** rates are **higher** than the ITE blended rates we used previously, but the measured **PM peak** hour rates are **lower**. Using the measured rate has the effect of exceeding the daily trip transfer allowance for programs greater than 4 million square feet, but also decreases the number of significant and adverse roadway segments as compared to using the ITE rates (following the standard DRI transportation analysis).

Table 1 provides a summary of three development scenarios using the monitored trip generation rates as well as the ITE trip generation rates, as follows:

1. The maximum development, based on the program provided by RERC on October 3 totaling 6.1 million square feet.
2. A reduced development program to match the trip entitlements available for transfer (30,692 daily trips, including 12,984 trips from Tradeport and 17,708 trips from SE Development Area). This scenario assumes the 4,484 trips from the Mud Lake area are available for transfer.
3. A reduced development program to match the trip entitlements available for transfer without the Mud Lake trips (26,208 daily trips).

The primary findings are as follows:

- Using the **monitored rates**, the current proposed development program leaves a deficit of approximately 16,000 daily trips above the maximum potential entitlement transfer' However, only 4 roadway segments are significantly and adversely impacted.
- Using **ITE rates**, the same maximum development program would only have a deficit of approximately 3,100 daily trips above the potential trip entitlement transfer, but would have significant and adverste impacts to 21 roadway segments.
- Using the **monitored rates**, the development program could be reduced to approximately 4 million square feet to match the potential trip entitlement transfer; this level of development would have a significant and adverse impact on 3 roadway segments.

- Using the **monitored rates**, the development program could be further reduced to approximately 3.42 million square feet to match the potential trip entitlement transfer if Mud Lake area trips are not transferred; this level of development would have a significant and adverse impact on only 2 roadway segments.
- If using the **ITE rates**, the development would have to be reduced to 5.5 million square feet to match the potential trip entitlements with Mud Lake trips included; however, this would have a significant and adverse impact on 19 roadway segments.
- With **ITE rates**, the development could be reduced to 4.64 million square feet to match the potential trip entitlements without the Mud Lake trips included; this would impact 15 roadway segments.

Based on our analysis, the use of the monitored rates versus the ITE rates has impacts on the amount of development that could be achieved to match the potential trip entitlements, as well as the number of off-site roadway segments that would be impacted and need mitigation. Using the monitored rates would allow for less development potential, but would have fewer off-site impacts, while the ITE rates would allow for more potential development, but would cause a much higher number of off-site impacts.

Please see the attached exhibits for more details on the trip generation and resulting roadway impacts, and contact Jason or me if you have questions.

Memo

To: Brad Friel, GOAA	
From: Jamie Krzeminski, PE, PTOE	Project: On-Call Transportation Planning
CC:	
Date: October 15, 2008	Job No: 80250

RE: Aviation Support Traffic Counts Summary

This memo provides a comprehensive tabular summary of the traffic counts recently collected for various aviation support uses at Orlando International Airport (OIA), as well as the resulting trip rates calculated based on the square footage and employee data provided by GOAA. A complete electronic version of the tabular count data is also being provided in a separate pdf file.

Traffic counts were collected at 23 locations adjacent to Tradeport Drive and Hangar Boulevard at OIA over a seven-day period from August 25-31, 2008. The specific count locations represent driveways and roadways providing access to various aviation support uses. Figures 1 and 2 show the locations counted on the Tradeport Drive and Hangar Boulevard corridors, respectively. The FAA Air Traffic Control Tower location (station 24) was previously counted in July 2007 as part of the North Terminal Capacity Evaluation project. Table 1 provides a summary of the average weekday volumes at each count station for five time periods, as follows:

1. Daily (average weekday volume)
2. AM peak hour between 7-9 AM
3. AM peak hour of generator (highest peak hour occurring during the AM hours)
4. PM peak hour between 4-6 PM
5. PM peak hour of generator (highest peak hour occurring during the PM hours).

Each of the automatic traffic counts was validated for accuracy through a one-hour manual count and adjusted as needed. Table 2 provides a summary of the validation conducted for each location, as well as the adjustment factor applied to each station.

Table 3 summarizes the relevant land use size, employment, and the monitored trip generation data for each specific land use studied. In addition, the table shows the trip rates per thousand square feet and per employee computed for each land use. Based on the work completed for the East Airfield EA, the land uses have been divided into two categories, as follows:

- Category A: Airport Support District – includes aircraft maintenance, manufacturing hangar, and cargo facilities
- Category B: Airport Support Areas – includes office, flight training centers, and ATC facilities

It should be noted that the Air Tran Headquarters and Signature FBO, which were counted together due to the layout of the building access and parking areas (stations 14 + 15 + 16), has been excluded from the trip rate computations. The monitored trips and computed trip rates have been provided for the five periods described above. Table 3 also includes a comparison to the ITE trip rates previously used for the East Airfield traffic analysis to calculate an aggregate aviation support trip rate (i.e., equal parts light industrial, manufacturing, and warehousing), as well as general office rates.

Because PM peak hour (4-6 PM) directional traffic data and forecasts are typically required for any regional traffic studies such as DRI-related studies, Table 4 provides the entering and exiting monitored traffic data and computed trip rates under each of the two airport support land use categories.

If you have any questions about the data or the summaries provided, please contact me.

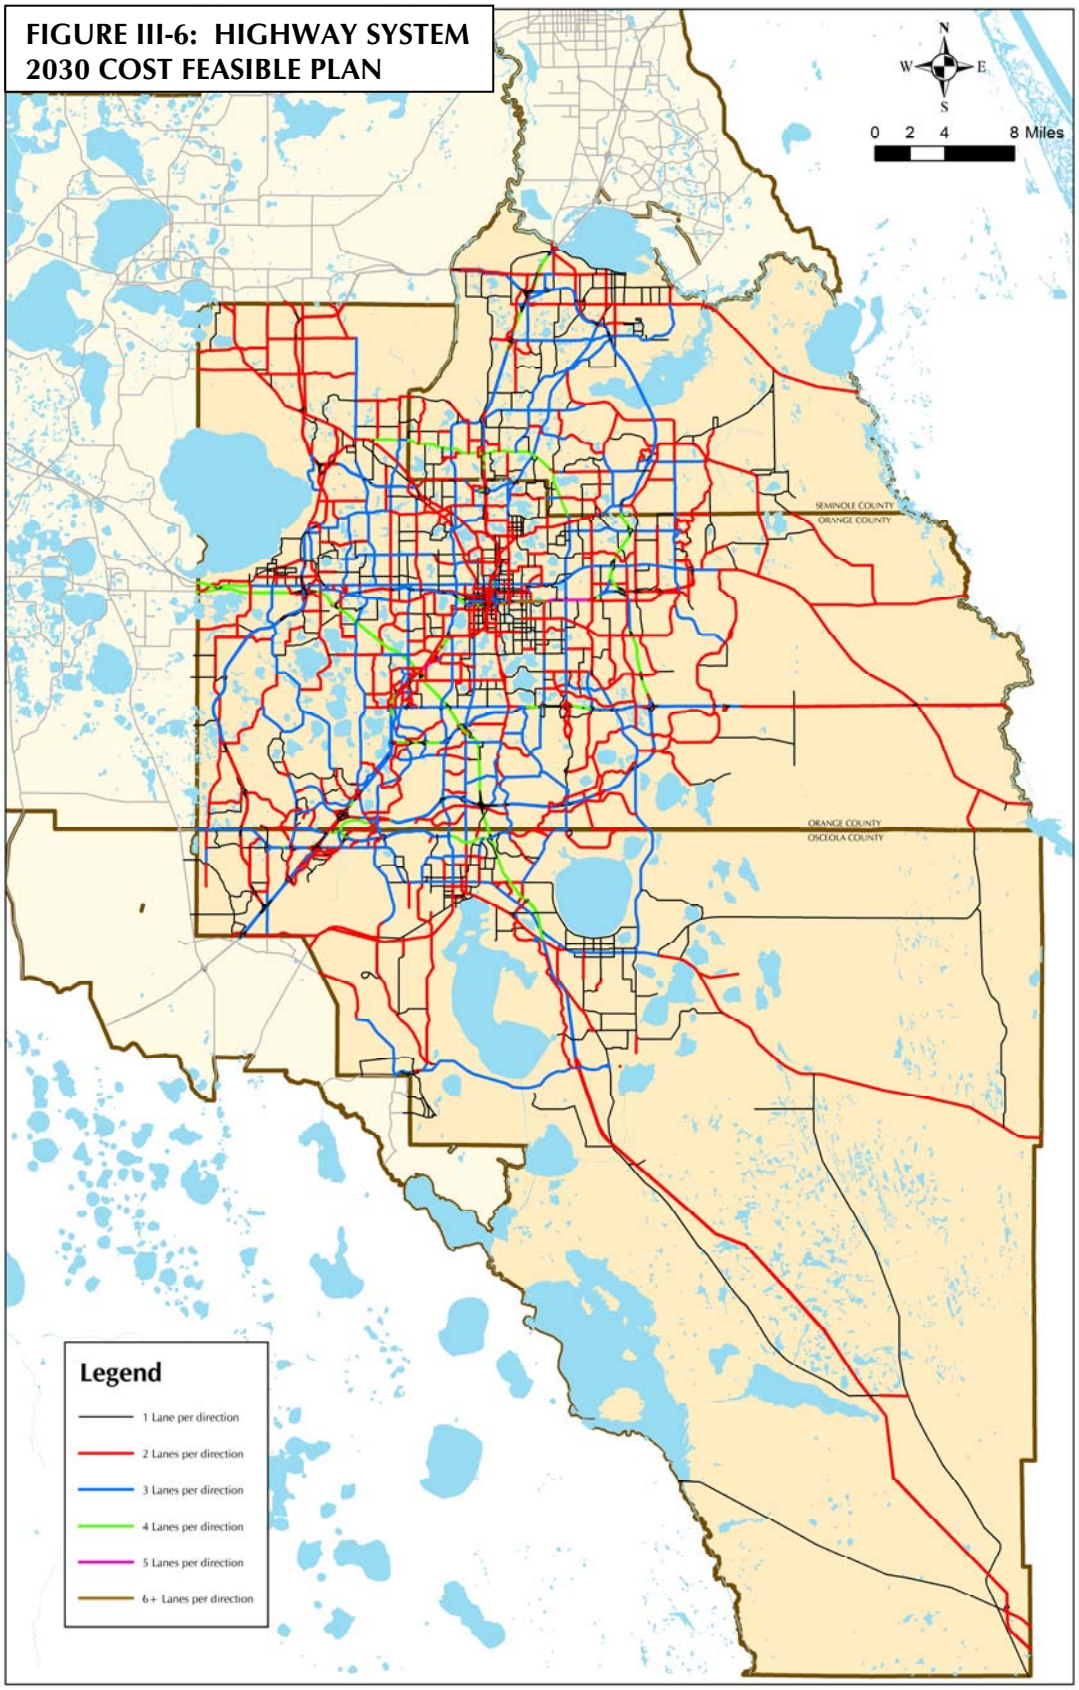
FIGURE III-6: HIGHWAY SYSTEM 2030 COST FEASIBLE PLAN



METROPLAN ORLANDO
A Regional Transportation Partnership

2030 Long Range Transportation Plan

Orange County Local Project Costs by Plan Year (Tier 3 Funding)

				Budget Allocation by Year ($000's)				
Jurisdiction	Priority	Project Name	Improvements	2008	2015	2020	2025	2030
County	Project List	All American Boulevard (Clarcona Ocoee Rd. to Forest City Rd.)	Realignment, new 4 lanes	11,485.3	14,701.2	-	-	-
County		Reams Road (2500' south of CR 535 to CR 535	Realignment, widen 2-4	2,965.0	3,795.2	-	-	-
City of Orlando		Dowden Road (Narcoosee Rd. to Greenway)	New 4 lanes	47,217.4	60,438.2	-	-	-
City of Orlando		Metrowest Boulevard (Kirkman Rd. to Mission Rd.)	New 2 lanes	2,300.0	2,944.0	-	-	-
City of Orlando		Mission Road (Conroy Rd. to Metrowest Ext.)	New 4 lanes	15,000.0	19,200.0	-	-	-
County		International Drive South (S. Westwood Blvd. to N. Westwood Blvd.)	Widen 4-6	11,100.0	14,208.0	-	-	-
County		Lake Underhill Road (Dean Rd. to Rouse Rd.)	Widen 2-4	11,952.2	15,298.8	-	-	-
County		Moss Park Road Ext. (Moss Park Rd. to Innovation Place)	New 4 lanes	44,665.1	57,171.3	-	-	-
County		Taft-Vineland Rd. Ext. (Central Florida Parkway to John Young Parkway)	New 4 lanes	5,630.0	7,206.4	-	-	-
County		Wildwood Avenue (International Dr. to Palm Pkwy.)	New 4 lanes, bridge	21,000.0	26,880.0	-	-	-
County		Winter Garden-Vineland Road (Magnolia Pk. Ct. to south of SR 429)	Widen 2-4	10,840.0	13,875.2	-	-	-
County		Winter Garden-Vineland Road (Ficquette Rd. to Southern Way)	Widen 2-4	4,533.6	5,803.0	-	-	-
County		Canadian Court Ext. (International Dr. to John Young Parkway)	New 4 lanes	21,750.0	27,840.0	-	-	-
County		Econlockhatchee Trail (Orlando City Limits to Curry Ford Road)	Widen 2-4	10,715.8	13,716.2	-	-	-
County		Econlockhatchee Trail (Curry Ford Road to SR 50)	Widen 2-4	17,310.1	22,156.9	-	-	-
County		Lake Underhill Road (Goldenrod Rd. to Chickasaw Tr.)	Widen 2-4	4,984.0	6,379.5	-	-	-
County		Pine Hills Road (S. Overland Rd to Beggs Rd)	Realignment	1,276.1	1,633.5	-	-	-
County		Pine Hills Road Ext. (Beggs Rd. to Apopka Blvd)	New 4 lanes	7,656.9	9,800.8	-	-	-
County		Pine Hills Road Ext. (Apopka Blvd to US 441)	New 4 lanes	1,276.1	1,633.5	-	-	-
County		Boggy Creek Road (Osceola County Line to SR 417)	Widen 2-4	18,980.0	24,294.4	-	-	-
County		Lake Underhill Road (Chickasaw Tr. To Dean Rd.)	Widen 2-4	16,073.7	20,574.3	-	-	-
City of Orlando		Augusta National Drive (Bent Pine Dr. to Hoffner Ave.)	New 2 lanes	3,000.0	3,840.0	-	-	-
City of Orlando		Boone Avenue (Anderson St. to Lucerne Terrace)	New 2 lanes	2,800.0	3,584.0	-	-	-
City of Orlando		Econlockhatchee Trail (City Limits to Lee Vista Blvd.)	Widen 2-4	12,000.0	15,360.0	-	-	-
City of Orlando		Grand National Drive Overpass (Oak Ridge Rd. to E. Half of Caravan Ct.)	New 4 lanes	20,000.0	25,600.0	-	-	-
City of Orlando		Grand National Drive/Greenbrier Parkway (Sand Lake Rd. to International Dr.)	Widen 2-4 and align	10,000.0	12,800.0	-	-	-
City of Orlando		Hazeltine National Drive (Goldenrod Rd. to Narcoossee Rd.)	New 4 lanes	10,000.0	12,800.0	-	-	-
City of Orlando		Hazeltine National Drive (1500' E of TPC Blvd. to Goldenrod Rd.)	New 4 lanes	4,466.5	5,717.1	-	-	-
Federal		US 192 (Lake Co. Line to Secret Lake Dr)	Widen 4-6	14,893.6	19,063.8	-	-	-
City of Orlando		Lake Nona E/W Road (Boggy Creek Rd. to Narcoossee Rd.)	New 4 lanes	59,978.8	76,772.9	-	-	-
City of Orlando		Lake Nona Eastern Road (Lake Nona N/S Road to Narcoossee Rd.)	New 4 lanes	28,075.2	35,936.3	-	-	-
City of Orlando		Lee Vista Boulevard (Conway Rd. to 1900' W of Semoran Blvd.)	Widen 2-4	5,000.0	6,400.0	-	-	-
City of Orlando		Lee Vista Boulevard (SR 417 to Young Pine Rd.)	New 4 lanes	12,123.4	15,517.9	-	-	-
City of Orlando		Mission Road (Metrowest Blvd. to Old Winter Garden)	New 2 lanes	15,000.0	19,200.0	-	-	-
City of Orlando		Narcoossee Road (SR 417 to SR 528)	Widen 4-6	10,000.0	12,800.0	-	-	-
City of Orlando		Pine Street (Hughey Ave. to Garland Ave.)	New 2 lanes	1,200.0	1,536.0	-	-	-
City of Orlando		Shadowridge Road (Forbes Place to Lee Vista Blvd.)	New 4 lanes	5,000.0	6,400.0	-	-	-
City of Orlando		Terry Avenue (Anderson St. to Robinson St.)	Capacity Improvements	1,500.0	1,920.0	-	-	-
City of Orlando		Terry Avenue (Robinson St to SR 50 (Colonial Dr))	New 2 lanes	6,000.0	7,680.0	-	-	-
City of Orlando		Terry Avenue (Gore St. to Anderson St.)	New 2 lanes	3,500.0	4,480.0	-	-	-
County		Fenton Street (Apopka-Vineland Road to Palm Pkwy.)	Realignment, new 4 lanes	24,300.0	31,104.0	-	-	-
